bachelor thesis from the year 2015 in the subject chemistry macromolecular chemistry polymer chemistry grade 1 3 zuyd university of applied sciences language english abstract the aim of this work was to test the in vitro permeability of apis active pharmaceutical ingredients across perforated and unperforated skin both traditional adhesive matrices and hydrogel matrices were developed and tested the result of this work is that it is possible to deliver model substances greater than 500da through the skin barrier by perforating the epidermis transdermal therapeutic systems tts are dosage forms developed to transport an active pharmaceutical ingredient through the skin this is done by applying a patch to the skin and is therefore a pain free method since the establishment of this method tts have been a good alternative to traditional dosage forms such

as tablets injection needles and suppositories however there is a crucial limit to tts apis which are significantly greater than 500da 500g mol cannot pass through the skin barrier as several publications cf cormier et al 2004 roxhed 2007 and yu et al 2015 have shown there is a possibility to transport apis which are greater than 500da through the skin combining tts with microneedles mn is a way to produce microchannels through which the api can then pass the skin barrier customary mn systems were not sufficient to perforate the skin barrier hypodermic needles however are suitable to perforate the stratum corneum sc consequently the combination of tts technology with mn technology is possible and should be further developed nevertheless suitable mn have to be found hollow needles which are incorporated into a hydrogel matrix are a very promising option for a future product
